
JoomlaPDT 0.1

Posted by SVTechie - 2008/05/10 13:56

JoomlaPDT is aimed as standalone Joomla Installation for debug & development purposes. It is integrated with Eclipse PDT IDE and WampServer.

- * This is still beta release so please install at c:\wamp only
- * Everything else is working out of box
- * Joomla! & WampServer are up without any configuration requirement
- * Java VM is required to run Eclipse PDT

After installation, run wampserver & Joomla can be accessed at <http://localhost/Joomla>.

For Debug, launch start PDT or Eclipse, Joomla Project is built-in. Right click on index.php in the file list and "run as->php script", and Joomla page will be loaded inside Eclipse.

Joomla! components and modules can be debugged as being developed!

Download JoomlaPDT 0.1 in download section.

The major components are:

- * Eclipse PDT all in one!
 - ** Regular Expressions perspective
 - ** Updated plugins
 - ** Comes with full installation wizard and menu bindings
 - ** SQL Explorer
 - ** xDebug Debugger
 - ** Zend Debugger
 - ** Image Viewer Plugin
 - ** Zend Framework library including Google Apps API
 - ** Modified configuration to allow MySQL access from within PHP projects
- * WampServer2.0c - Most user friendly Windows Apache, MySQL, PHP tool
 - ** Includes MySQL tools
 - ** phpMyAdmin
- * Joomla 1.0.15 pre-installed
 - ** Easily upgradeable by user
 - ** Pre-defined IDE Project for Joomla installation
 - ** Default ID/password: admin, admin
 - ** Users have full local access to all Joomla! files, phpmyadmin and configuration options.
- * Standalone installer with start menu bindings.

How can I run JoomlaPDT with Joomla 1.5? Is it compatible?

I am new on these types of dev environment. Any help I can get will be very welcome!

Thks,

Pissarra

Yes, Joomla 1.5 can be supported easily.

Just follow these steps:

1. Extract Joomla1.5 in c:\wamp\www\Joomla15
2. Click on "WampServer" icon in tray menu and click on phpMyAdmin.
3. Create new database name joomla15 in phpmyAdmin
4. Open <http://localhost/Joomla15>
5. Follow installation steps for Joomla! For MySQL settings, username is root with no password. Host is localhost and database name is joomla15.
6. Open PDT/Eclipse
7. create new project name Joomla15 and keep default project options.

It should be up.

First of all thks for the response.

I have done what you said and here is the result:

- 1) When I select the original Joomla installation 1.0.15 that comes with the package, it shows all Contants, Classes and Functions. When I select the newlyly created project for Joomla 1.5.3, it does not show anything on these areas.
- 2) I can run and the frontpage shows in the Browser Output. When I select one of the menu options that I have created to go to "Send New WebLink" it displays the following text and not the page as it should be:

Thanks in advance for any help you can give me... I am a newbie at these type of development and I am looking for help everywhere I can get.

My objective is to have a dev environment that I can run, debug and create in Joomla! 1.5.X. If you can also point to Wizards that will help me create a component, module and/or plugins, that would also be great.

Thanks,

Pissarra

Moved to new topic, this topic is for JoomlaPDT announcements only.
